

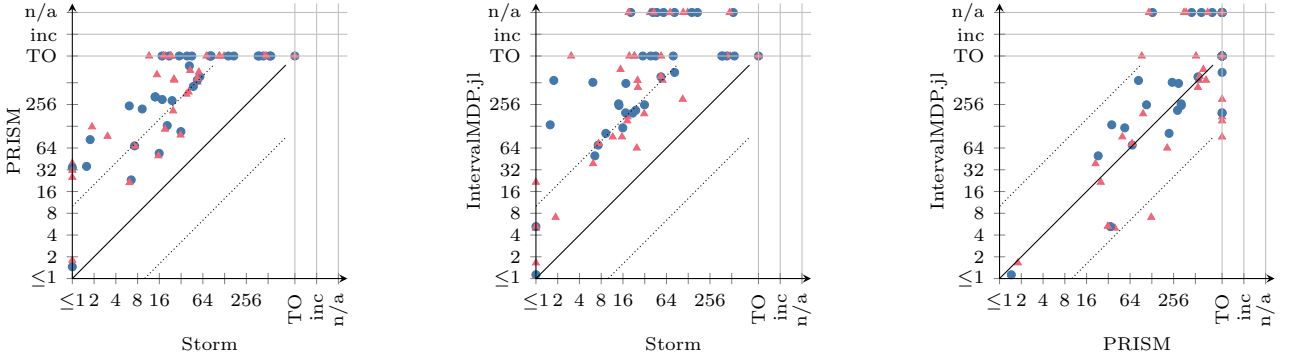

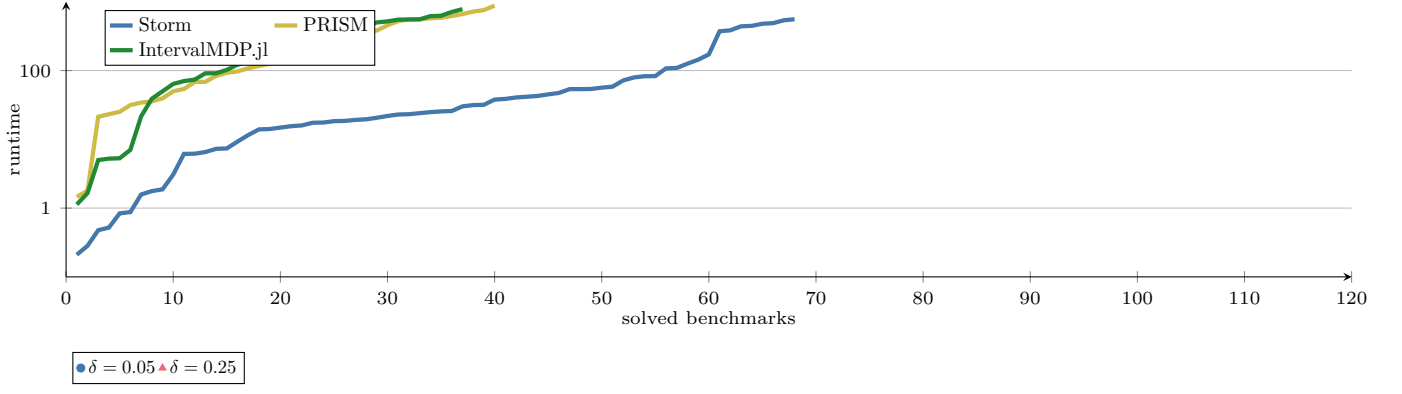

Figure 1: Comparison of Storm, PRISM and IntervalMDP.jl on interval MDPs with interval width δ . Runtimes are wallclock times of the whole tool call. Top: quantile plot of the runtimes. Bottom: runtimes of pairs of tools. Points marked *TO* ran out of time or memory, *inc* disagree with the result most tools agree on, and *n/a* produced no result or were not applicable, e.g. IntervalMDP.jl on reward benchmarks.

Interval MDPs

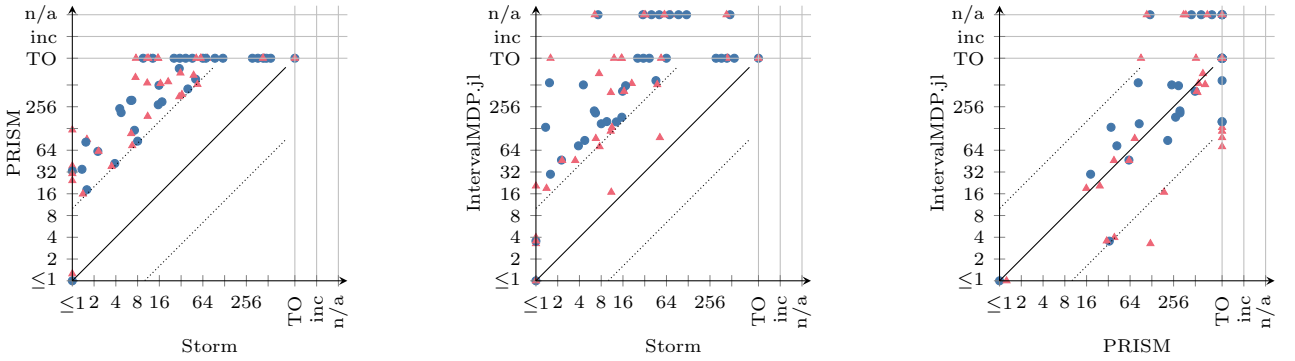

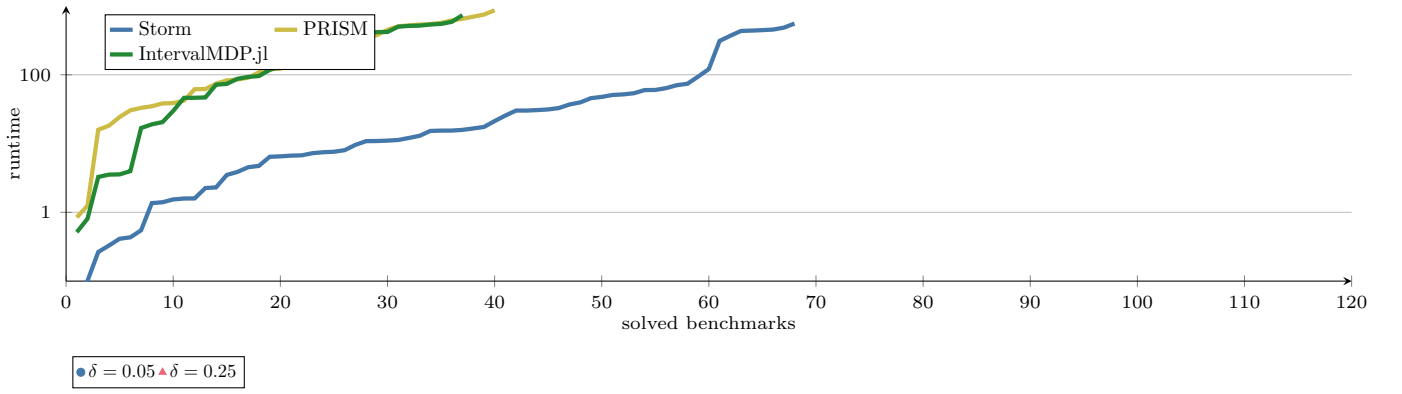

Figure 2: As Figure 1, but with the time each tool reports for model checking only, i.e. without starting the tool and reading and building the model.
